ray | magic beams

ray | magic beams is the perfect radiant panel to create radiant surfaces between exposed beams in wood, metal or concrete, with a clear width up to 60 cm.

ray | magic beams is directly cut to the desired width with a simple cutter up to a minimum width of 45 cm by cutting the polystyrene side and following the pre-precision lines. It can also be made smaller up to 40 cm by using a portable circular saw, cutting the plaster side and following the lines pre-defined by laser.

ray | magic beams is finished with a plaster-covered slab that is only 6 mm. Light and high performance, it is very simple to install because it joins together without requiring tools or closing the joint area.

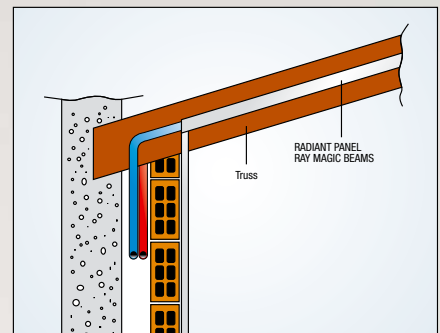

ray | magic beams is directly fastened to the ceiling with 65 mm screws (and screw anchors for tile ceilings) without using metal structures. The total thickness is 46 mm. They can be connected in a series of up to 20 panels (40 sub-modules) for a total length of 48 m.

ray | magic beams
 yield of the 40/60x120 submodular panel.

ray | magic beams
 example of supply line.

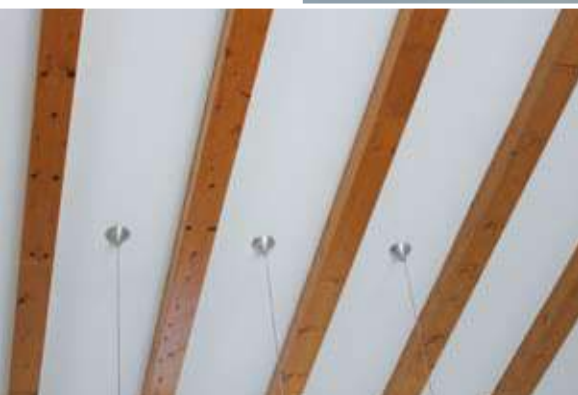

ray | magic beams
 it is sub-modular and is therefore used
 in 120-cm multiples.
